

It would be nice if the traditional telephone companies could supply broadband DSL to all their customers, especially in the rural. It is my understanding that they do not because they have to lease their network to their competitors if they do build. Why is it that the cable companies can choose where ever they want to go, and do not have to share they cables with anyone? They do not have to provide cable networks if it is not profitable for them, but telephone companies have to provide service no matter how remote a location. This does not seem fair. Cable is no longer just for T.V. service. You can do internet access and phone over the internet. Does this not make them have to follow the rules of all telecom companies?
